Thermo ELECTRON CORPORATION

Orion AQUAfast® II Photometer Ozone

● Operation

power — Switch the unit on using the "power" switch

O3 — This display shows the method. Press the "mode" key until the desired method is displayed.

Fill a clean vial with the sample up to the 10 ml mark, screw the cap on, and place in the sample chamber with the ∇ vial mark aligned with the Δ housing mark.

zero test — Press the "zero/test" key.

METHOD — The method symbol flashes for approx. 3 seconds.

0.0.0 — Confirms zero calibration.

After zero calibration is completed, remove the vial from the sample chamber.
The characteristic color starts to appear after the addition of the reagent tablet(s) (see "Method Preparation").
Cap the vial again and place in the sample chamber with the ∇ and Δ marks aligned.

zero test — Press the "zero/test" key.

METHOD — The method symbol flashes for approx. 3 seconds.

RESULT — The result appears in the display.

Repeat the analysis:
Press the "zero/test" key once again.
New zero calibration:
Press the "mode" key until the desired method symbol appears in the display again.

● User messages

EOI	Light absorption too great. Reason - e.g. soiled lens.
÷Err	Measuring range exceeded or excessive turbidity.
-Err	Result below measuring range limit.
LO BAT	Replace 9 V battery immediately; no further analysis are possible.

● Technical data

Optics:	LED: λ = 605 nm
Battery:	9 V block battery (life = approx. 600 tests)
Auto-OFF:	Auto unit switch-off approx. 5 minutes after a key was last pressed.
Ambient conditions:	5-40°C 30-90% rel. humidity (non-condensing)
Compliance:	DIN EN 55 022, 61 000-4-2, 61 000-4-8, 50 082-2, 50 081-1, DIN V ENV 50 140, 50 204 FCC Part 15 Class A ICES – 003 Issue 2

● Ozone 0.05 - 0.5 mg/l Method Preparation

0.0.0 — Perform zero calibration (see “Operation”).
Then take the vial from the sample chamber and empty it. Rinse a beaker with the sample which is to be analyzed. Crush an OZONE tablet in the rinsed beaker. Add exactly 20 ml of the sample. Carefully mix the sample using the stirrer until all particles are fully dissolved. Fill the vial with the solution to the 10 ml mark. Screw the cap on and position the vial in the compartment making sure the ∇ and Δ marks are aligned.

zero test — Press the "zero/test" key.

O3 — The method symbol flashes for approx. 3 seconds.

RESULT — The result is shown in the display in mg/l ozone.

Tolerance: ± 0.05 mg/l

● Calibration Standards

Standards for calibration should be prepared similar to samples.

● Notes

1. During sample preparation, avoid the loss of ozone due to pipetting or shaking. The analysis must be performed immediately after the sample is taken.
2. Highly alkaline or acidic water must be neutralized prior to analysis.
3. The malonic acid in the tablet prevents chlorine from interfering with the process. Bromine (or bromide oxidized by the ozone) interferes with the analysis. 1 mol HOBr is equivalent to 0.4 mol ozone.
4. H_2O_2 and organic peroxides react extremely slowly and the interference is therefore negligible.
5. Fe(III) does not interfere. Mn(II) is oxidized by ozone and interferes with the analysis.

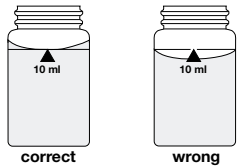
● Method notes

Observe application options, analysis regulations and matrix effects of methods. Reagent tablets are designed for use in chemical analysis only and should be kept well out of the reach of children.

If necessary, request material safety data sheets.

Ensure proper disposal of reagent solutions.

● Correct filling of the vial



● Avoiding errors in photometric measurements

1. Thoroughly clean vials, caps and stir rod **after each analysis** in order to prevent carry-over errors. Even minute reagent residues lead to incorrect measurements. Use the supplied brush for cleaning.
2. Ensure that the outer walls of the vials are dry and clean before performing the analysis. Fingerprints or water droplets on the light entry surfaces of the vials lead to incorrect measurements.
3. “Zero calibration” and “Test” must be performed using the same vial, since different vials can possess slightly different tolerances.
4. For “Zero calibration” and “Test”, ensure that the vial is always positioned in the sample chamber in such a way that the graduation with the white triangle points toward the marking on the housing.
5. Always perform “Zero calibration” and “Test” with capped vials.
6. Bubbles on the inside walls of the vial can lead to incorrect measurements.

   To prevent this, cap the vial and remove the bubbles by swirling the vial before performing the test.
7. You must prevent water from penetrating into the sample chamber. The entry of water into the housing of the photometer can destroy electronic components and lead to corrosion damage.
8. Soiling of the lens (LED and photosensor) in the sample chamber leads to incorrect measurements.

   Check - and if necessary clean - the light entry surfaces of the sample chamber at regular intervals. Clean using a moist cloth and cotton balls.
9. Always add the reagent tablets to the sample straight from the foil without touching them with your fingers.
10. Major temperature differentials between the photometer and the environment can lead to incorrect measurements - e.g. due to the formation of condensate in the area of the lens or on the vial.

    Specified tolerances at T = 20 °C.
11. For best results pipette samples.

● Calibration mode

mode — Press ans hold "mode" key.

power — Switch unit on using "power" key.
Release "mode" key after approx. 1 second.

CAL
O3
These following messages will alternate in the display.
If necessary, press "mode" key until the desired method alternates with CAL.

zero test — Perform zero calibration as described.
Press the "zero/test" key.

METHOD — The method symbol flashes for approx. 3 seconds.

0.0.0
CAL
These messages will alternate in the display.

zero test — Place the standard to be used in the sample chamber with the ∇ and Δ marks aligned (see "Method Preparation"). Press the "zero/test" key.

METHOD — The method symbol flashes for approx. 3 seconds.

RESULT
CAL
The result is shown in the display alternating with CAL.

If the result corresponds to the value of the standard used (within the allowed tolerance), exit calibration mode by pressing the "power" key.

mode
zero test
Pressing the "mode" key once increases the displayed result by 1 digit.
Pressing the "zero/test" key once decreases the displayed result by 1 digit.

CAL
RESULT ÷ x
Continue pressing the keys until the displayed result corresponds to the value of the standard used.

power — If you press the "power" key twice, the new correction factor is calculated and stored in the user calibration level.

: : — Confirms calibration (3 seconds).

● Note

CAL — Factory calibration active.

cAL — Calibration has been set by the user.

● Recommended calibration value

Ozone: between 0.05 and 0.1 mg/l O_3

● User calibration : cAL
Factory calibration : CAL

The unit can be reset to the factory calibration as follows:

mode + zero test — Press and hold both "mode" and "zero/test" together.

power — Switch the unit on using the "power" key. Release "mode" and "zero/test" keys after approx. 1 second.

The following messages will alternate in the display.

SEL
CAL
The unit is in delivery condition.
(SEL stands for Select)

or:

SEL
cAL
The unit operates with a calibration performed by the user. (If the user calibration is to be retained, switch the unit off using the "power" key.)

mode — Factory calibration is activated by pressing the "mode" key. The following messages will alternate in the display:

SEL
CAL

power — Switch the unit off using the "power" key.

● User notes

E 10	Calibration factor “out of range”
E 70	Factory calibration incorrect / deleted
E 71	User calibration incorrect / deleted

Technical changes without notice.
Printed in Germany.
